Data Cleaning Process in Python

**Removed missing values using
fillna("")**

Cleaned and standardized text data

Created new column Remote (1 = Remote, 0 = Not Remote)

Prepared text data for machine learning using TF-IDF

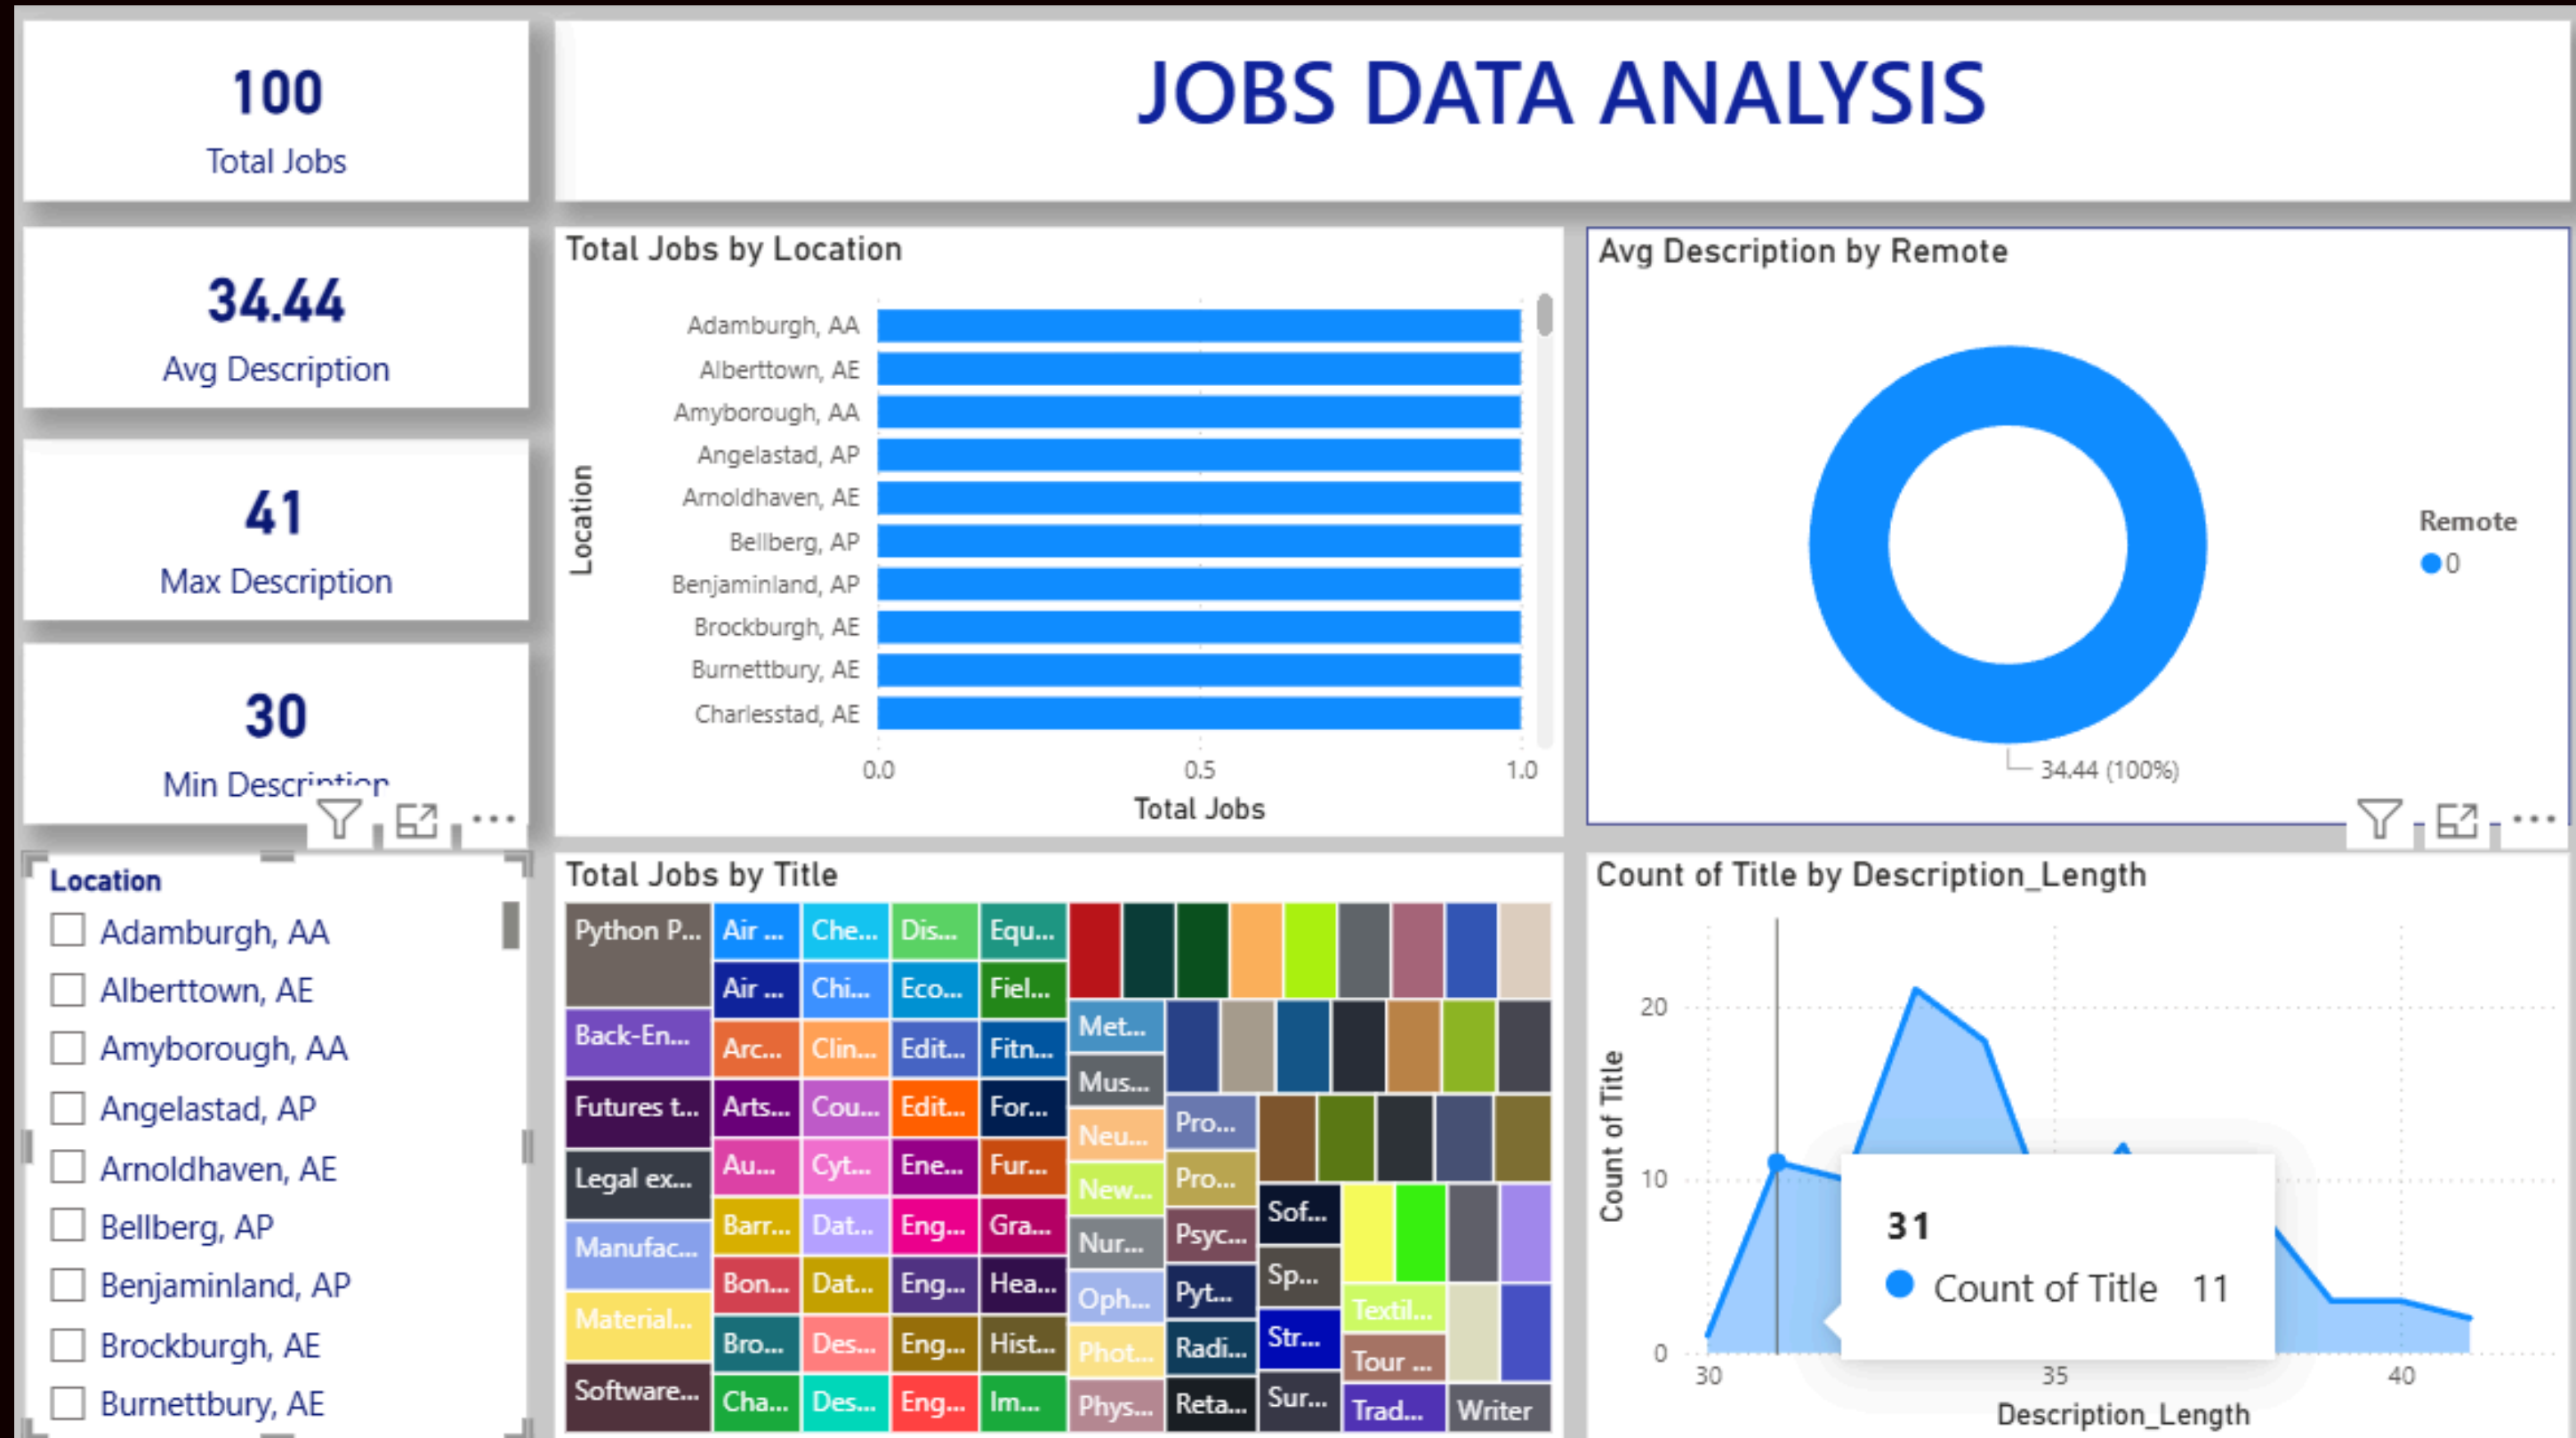

What is a DAX Measure?

The Definition: A formula that calculates a result based on the filters you select in your dashboard.

The Key Difference: Unlike a calculated column, a measure does not store data; it calculates it "on the fly" when you click a slicer.

The Analogy: It's like a calculator that waits for you to tell it which city or job title to look at before it gives an answer.
